# Big (or small) data and William & Mary EXTREEMS-QED program

Junping Shi

College of William and Mary

January 21, 2015

#### **EXTREEMS-QED**

Expeditions in Training, Research, and Education for Mathematics and Statistics through Quantitative Explorations of Data (EXTREEMS-QED) program is an National Science Foundation educational program to support efforts to educate the next generation of mathematics and statistics undergraduate students to confront new challenges in computational and data-enabled science and engineering (CDS&E). EXTREEMS-QED projects will enhance the knowledge and skills of mathematics majors through training that incorporates computational tools for analysis of large data sets and for modeling and simulation of complex systems.

## CDS&E: A New Discipline

CDS&E is now clearly recognizable as a distinct intellectual and technological discipline lying at the intersection of applied mathematics, statistics, computer science, core science and engineering disciplines. It is dedicated to the development and use of computational methods and data mining and management systems to enable scientific discovery and engineering innovation.

We regard CDS&E as explicitly recognizing the importance of data-enabled, data-intensive, and data centric science. CDS&E broadly interpreted now affects virtually every area of science and technology, revolutionizing the way science and engineering are done. Theory and experimentation have for centuries been regarded as two fundamental pillars of science. It is now widely recognized that computational and data-enabled science forms a critical third pillar.

#### What is Big Data

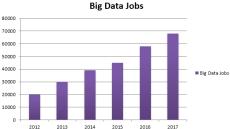

## Everyone talks about it

- (Mar 2012) Obama Administration unveils "Big data" initiative: announces \$200 million in new R&D investment
- 2 New York Times (Feb 2012): The Age of Big Data
- Harvard Business Review (Oct 2012): (i) Big Data: The Management Revolution; (ii) Data Scientist: The Sexiest Job of the 21st Century
- Wall Street Journal (Mar 2013): How Big Data Is Changing the Whole Equation for Business
- Wall Street Journal (Apr 2012): Big Data's Big Problem: Little Talent (nobody really knows how to do it)
- Since 2012, new data science institutes (initiatives) have been established in MIT, UC Berkeley, Columbia U, Duke U, NYU, U Virginia and many other universities (everyone thinks everyone else is doing it, so everyone claims they are doing it)

#### Big Data Job Market

#### What is big data: definitions

From http://www.technologyreview.com/view/519851/the-big-data-conundrum-how-to-define-it/

"And yet ask a chief technology officer to define big data and he or she will will stare at the floor. Chances are, you will get as many definitions as the number of people you ask. And thats a problem for anyone attempting to buy or sell or use big data services—what exactly is on offer?"

- 1. Gartner. In 2001, a Meta (now Gartner) report noted the increasing size of data, the increasing rate at which it is produced and the increasing range of formats and representations employed. This report predated the term "big data" but proposed a three-fold definition encompassing the "three Vs": Volume, Velocity and Variety. This idea has since become popular and sometimes includes a fourth V: Veracity, to cover questions of trust and uncertainty.
- Oracle. Big data is the derivation of value from traditional relational database-driven business decision making, augmented with new sources of unstructured data.
- 3. Intel. Big data opportunities emerge in organizations generating a median of 300 terabytes of data a week. The most common forms of data analyzed in this way are business transactions stored in relational databases, followed by documents, e-mail, sensor data, blogs, and social media.

#### What is big data: definitions

From http://www.technologyreview.com/view/519851/the-big-data-conundrum-how-to-define-it/

- 4. Microsoft. Big data is the term increasingly used to describe the process of applying serious computing power—the latest in machine learning and artificial intelligence—to seriously massive and often highly complex sets of information.
- 5. The Method for an Integrated Knowledge Environment open-source project. The MIKE project argues that big data is not a function of the size of a data set but its complexity. Consequently, it is the high degree of permutations and interactions within a data set that defines big data.
- The National Institute of Standards and Technology. NIST argues that big data
  is data which "exceed(s) the capacity or capability of current or conventional
  methods and systems." In other words, the notion of "big" is relative to the
  current standard of computation.
- 7. Their definition: Big data is a term describing the storage and analysis of large and or complex data sets using a series of techniques including, but not limited to: NoSQL, MapReduce and machine learning.
- 7. Your definition?

## How big is the data

```
1000 = kilobyte(KB); \ 1000^2 = megabyte(MB) \\ 1000^3 = gigabyte(GB); \ 1000^4 = terabyte(TB) \\ 1000^5 = petabyte(PB); \ 1000^6 = exabyte(EB) \\ 1000^7 = zettabyte(ZB); \ 1000^8 = yottabyte(YB).
```

- As of 2012, every day 2.5 exabytes  $(2.5 \times 10^{18})$  of data were created, with 2012 total about 2.7 zettabytes
- Facebook generates 10 terabytes data daily, and Twitter generates 7 terabytes daily
- Wal-Mart handles more than 1 million customer transactions every hour, feeding databases estimated at more than 2.5 petabytes.

<sup>&</sup>quot;Big" means big volume, big velocity, and big variety.

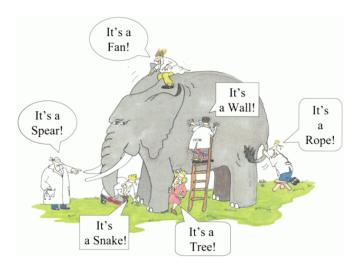

# Types of data

- Signal (time series)  $f: \mathbb{R} \to \mathbb{R}$ , or  $f: \mathbb{Z} \to \mathbb{R}$
- Image:  $f:[0,1]\times[0,1]\to\mathbb{R}$  (black-white) of  $f:[0,1]\times[0,1]\to\mathbb{R}^3$  (colored)
- Spreadsheet:  $N \times M$  matrix  $A = (a_{ij})_{N \times M}$
- Higher dimensional spreadsheet: matroid  $A = (a_{ijkl})_{N \times M \times P \times Q}$  (4-dimensional)
- Social media data: a graph with vertices (people), nodes (connected or not) and spreadsheet (personal info)
- Spatial data (ecological observation, astronomy observation):  $f: \mathbb{R} \times X \to D$  ( $\mathbb{R}$ =time, X=space, D=data collected at that location and time)

EXTREEMS-QED Big Data Mathematics and data W&M EXTREEMS-QED Conclusion

#### Mathematics and Data

We are all like blind men feeling an elephant, and big data is that elephant.

#### Compressed sensing (linear algebra)

Compressed sensing (also known as compressive sensing, compressive sampling, or sparse sampling) is a signal processing technique for efficiently acquiring and reconstructing a signal, by finding solutions to underdetermined linear systems. An underdetermined system of linear equations has more unknowns than equations and generally has an infinite number of solutions. In order to choose a solution to such a system, one must impose extra constraints or beliefs (such as smoothness) as appropriate.

1 Undersample

A camera or other device captures only a small, randomly chosen fraction of the pixels that normally comprise a particular image. This saves time and space.

2 Fill in the dots

An algorithm called /4 minimization starts by arbitrarily picking one of the effectively infinite number of ways to fill in all the missing pixels.

3 Add shapes

The algorithm then begins to modify the picture in stages by laving colored shapes over the randomly simplest kind, that selected image. The goal is to seek pixels. If it sees what's called sparsity, a measure of image may add a green simplicity.

The algorithm inserts the smallest number of shapes, of the four adjacent green pixels, it rectangle there.

#### 4 Add smaller shapes

iteration, the algorithm adds smaller and match the original sparsity.

#### 5 Achieve clarity Iteration after

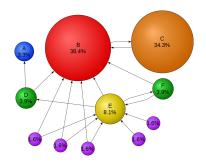

smaller shapes. always seeking Eventually it creates an image that will almost certainly be a near-perfect facsimile of a hires one

# Page Rank (linear algebra)

PageRank is an algorithm used by Google Search to rank websites in their search engine results. PageRank is a way of measuring the importance of website pages. According to Google: "PageRank works by counting the number and quality of links to a page to determine a rough estimate of how important the website is. The underlying assumption is that more important websites are likely to receive more links from other websites."

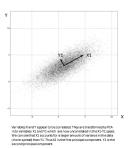

http://en.wikipedia.org/wiki/PageRank

## Principal component analysis (statistics)

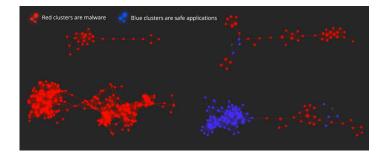

Principal component analysis (PCA) is a statistical procedure that uses orthogonal transformation to convert a set of observations of possibly correlated variables into a set of values of linearly uncorrelated variables called principal components. The number of principal components is less than or equal to the number of original variables. This transformation is defined in such a way that the first principal component has the largest possible variance (that is, accounts for as much of the variability in the data as possible), and each succeeding component in turn has the highest variance possible under the constraint that it be orthogonal to (i.e., uncorrelated with) the preceding components.

## Topological data analysis (topology)

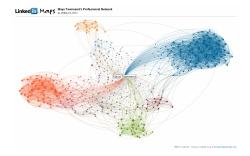

Topological data analysis (TDA) is a new area of study aimed at having applications in areas such as data mining and computer vision. The main problems are: (1) how one infers high-dimensional structure from low-dimensional representations; and (2) how one assembles discrete points into global structure. The human brain can easily extract global structure from representations in a strictly lower dimension, i.e. we infer a 3D environment from a 2D image from each eye. The inference of global structure also occurs when converting discrete data into continuous images, e.g. dot-matrix printers and televisions communicate images via arrays of discrete points.

# Network Science (graph theory?)

Network science is an interdisciplinary academic field which studies complex networks such as telecommunication networks, computer networks, biological networks, cognitive and semantic networks, and social networks. The field draws on theories and methods including graph theory from mathematics, statistical mechanics from physics, data mining and information visualization from computer science, inferential modeling from statistics, and social structure from sociology.

http://en.wikipedia.org/wiki/Network\_science

#### William and Mary EXTREEMS-QED

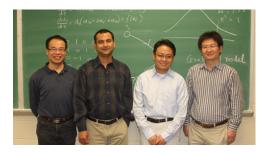

- Undergraduate curriculum development
  - Freshman, sophomore level introductory courses
  - New advanced courses in complex networks, graphical models, matrix and graph theory techniques in statistics
- 2 Summer research program
  - For each summer, 4-6 research teams will be formed with each team working on a data-enabled topic
  - Each team consists of 1-2 faculty advisers and 2-3 undergraduate students, with total of 8 faculty advisers and 12 research students per year
  - 1-2 faculty advisers and 2-4 students will be from partner HBCU institutes (Virginia St. U, Hampton U, Norfolk St. U)
- Faculty professional development and outreach activities

KTREEMS-QED Big Data Mathematics and data W&M EXTREEMS-QED Conclusion

## Faculty advisers

- Principal Investigator: Junping Shi (PDE and Math Biology)
- 2 Co-Principal Investigators: Tanujit Dey (Statistics), Chi-Kwong Li (Matrix Analysis), Gexin Yu (Graph Theory)
- Senior Personnel: Sarah Day (Computational Topology), John Delos (Physics), Ross Iaci (Statistics), Rex Kincaid (Operation Research), Drew LaMar (Biology), Larry Leemis (Operation Research), Rom Lipcius (Marine Science), George Rublein (Math Education), Margaret Saha (Biology), Leah Shaw (Adaptive Network), Greg Smith (Applied Sci), Ilya Spitkovsky (Functional Analysis), Anke van Zuylen (Optimization)

#### William and Mary EXTREEMS-QED courses

#### Spring 2015

MATH 352: Data Analysis (Daniel McGibney )

MATH 410-01: Topics in Graph Theory (Gexin Yu)

MATH 410-02: this class! (Junping Shi, Gexin Yu)
MATH 410-03: Research in Matrix Theory (Chi-Kwong Li)

MATH 452/552: Mathematical Statistics (Ross Iaci)

MATH 459: Topics in Statistics (Larry Leemis)

CSCI 648: Network Optimization (Anke Van Zuylen)

CSCI 658: Discrete Optimization (Rex Kincaid)

CSCI 668: Reliability (Larry Leemis)

**CSCI 688**: Stochastic Optimization (Frans Schalekamp)

#### Spring 2014 Math 410: Big Data Analysis

- Format: one-credit course with one lecture per week by faculty members or external speakers.
- Purpose: to introduce students to big data analysis, data science and possible undergraduate research projects (20 students in the class, and 5 entered 2014 summer EQ program).
- Requirement: students take notes for each lecture and write a summary as assignments.
- Sample topics: videos of 12 talks at https://www.youtube.com/channel/UC2BiuU8gzH7eF71xwj-VMIg Albert Decatur (AidData) Data from a Stone: Aid Transparency, PDF Ghettos, and Data Mining

Leah Shaw (Applied Science) Adaptive Social Networks John Delos (Physics) Saving Infants in a Heartbeat!

Margaret Saha (Biology) Big Data from RNA-Seq Experiments

Greg Smith (Applied Science) Visual and Virtual Data: Using Simulation to

Greg Smith (Applied Science) Visual and Virtual Data: Using Simulation to Manage Your Expectations

Ersin Ancel (NASA Langley) Data Mining at NASA Langley Research Center Rom Lipcius (Marine Science) Using Big Data for Marine Species to Achieve Conservation Goals

#### W&M EXTREEMS-QED summer research program

- Summer research program by teams of undergraduate students and faculty members starting summer 2014.
- 8-10 W&M undergrad students, and 2-4 undergrad students from Virginia State U, Hampton U, and Norfolk State U.
- Stipend \$4000 and free summer on-campus housing
- Eligibility: math major, US citizen/permanent residents (international students can apply for Charles center scholarship by March 20)
- 2015 Application deadline: March 27, 2015.
- 2015 Research Program: June 1-July 24, 2015 (8 weeks)

#### 2014 W&M EXTREEMS-QED summer research program

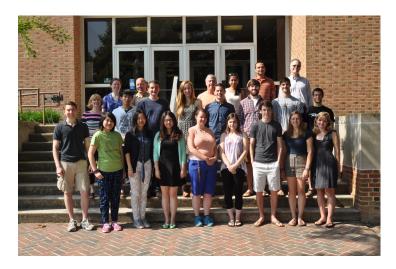

- Eric Berry: Decomposition of quantum gates (adviser: Li, Pelejo)
- Miranda Elliott: Automating data extraction in AidData (adviser: Kincaid)
- Aaron Finkle: High dimensional nonlinear modeling for analyzing robustness and plasticity in developing systems using transcriptome data (adviser: Saha, Vasiliu)
- Dean Katsaros: Decomposition of unitary gates (adviser: Li, Pelejo)
- Greg Kirwin: Adaptive social networks in online communities (adviser: Shaw)
- Devon Oberle: Text mining air transportation accident reports (adviser: Kincaid)
- Amanda Reeder (Norfolk State U): Heartbeats and Respiration (adviser: Delos, Lanz)
- Martin Salgado-Flores: Dynamics at continuous varying resolutions (adviser: Day)
- Robert Torrence: Identifying Message Boards as an Adaptive Network (adviser: Shaw)
- Fangyi Xu: study cell fate and differentiation in trichomes (adviser: Smith)

Other associated research students (not directly supported by EQ): Mayee Chen (adviser: Shi), Corynne Dech (adviser: Shaw), Wade Hodson (adviser: Lipcius, Shaw, Shi), Haomiao Li (adviser: Shi), Catherine King (adviser: Day), Jing Yi Zhou (adviser: Lipcius, Shaw, Shi)

Topics: sustainable agriculture, pattern formation in intertidal zone, oyster population

# 2014 W&M EXTREEMS-QED summer research program students and faculty members

#### Summer activities

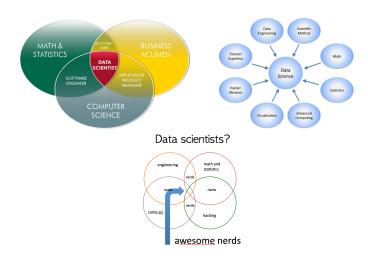

- Week 1-2: Short courses/tutorials (tutorials in R, Matlab, and statistics)(students have learned LaTeX in a sophomore course)
- Weekly student presentations (students make informal Beamer/Powerpoint presentation, and faculty members join discussions and help students to improve writing slides and presentation skills)
- Visiting large data centers, computing facilities and laboratories
  - Week 2: W&M cyclone cluster (on campus)
  - Week 3: DOE Thomas Jefferson Lab (40 miles away)
  - Week 4: W&M Biology Lab on RNA sequencing (on campus)
  - Week 5: NASA Langley Research Center Scientific Computing Group (30 miles away)
  - Future Plan: Univ. Virginia Data Science Institute (120 miles away), NSA, NIST or other federal computing facilities (150 miles away)

#### Faculty Development and Outreach

- Lectures by external speakers (March 21, Don Brown, U Va; Apr 11, Hans Kaper, G-Town U)
  - February 28, Xuemei Chen, University of Maryland, Compressed sensing, RIP, and the null space property
  - March 21, Donald Brown, Director of Data Science Institute, University of Virginia, The Transformative Power of Data
  - April 9, Eric Lock, Duke University, Exploratory Methods for the Integrated Analysis of Multi-Source Data
- Faculty members participating workshop, special year activities in data-related program
  - Gexin Yu: ICERM Semester Program on "Network Science and Graph Algorithms" (February–May, 2014)
  - Sarah Day: IMA Thematic Year on "Scientific and Engineering Applications of Algebraic Topology" (January–May, 2014)
  - 3 Tanujit Dey: International Biometric Society Eastern North American Region 2014 Spring Meeting (March 16–19, 2014)

#### Data Science and Data Scientists

#### Conclusion

- Big Data Analysis (Data Science) is a hot topic in the world of business and science, and Data Scientists are in high demand for the near future.
- Big data is not a well-defined disciplinary yet. It requires knowledge in statistics, computer science, engineering, and applied (and maybe even classical) mathematics.
- In W&M EXTREEMS-QED program, we hope to provide students a solid foundation in mathematics, statistics and computer science, and students can learn about frontier of this newly emerging science.
